

C. Longest Regular Bracket Sequence

time limit per test: 2 seconds

memory limit per test: 256 megabytes

input: standard input

output: standard output

This is yet another problem dealing with regular bracket sequences.

We should remind you that a bracket sequence is called regular, if by inserting «+» and «1» into it we can get a correct mathematical expression. For example, sequences « (()) () », « () » and « (() (())) » are regular, while «) () », « (() » and « (())) () » are not.

You are given a string of « (» and «) » characters. You are to find its longest substring that is a regular bracket sequence. You are to find the number of such substrings as well.

Input

The first line of the input file contains a non-empty string, consisting of « (» and «) » characters. Its length does not exceed 10^6 .

Output

Print the length of the longest substring that is a regular bracket sequence, and the number of such substrings. If there are no such substrings, write the only line containing "0 1".

Examples

input	Copy
) ((())) ((())	
output	Copy
6 2	

input	Copy
)) (
output	Copy
0 1
