

## D. Powerful array

time limit per test: 5 seconds

memory limit per test: 256 megabytes

input: standard input

output: standard output

An array of positive integers  $a_1, a_2, \dots, a_n$  is given. Let us consider its arbitrary subarray  $a_l, a_{l+1}, \dots, a_r$ , where  $1 \leq l \leq r \leq n$ . For every positive integer  $s$  denote by  $K_s$  the number of occurrences of  $s$  into the subarray. We call the *power* of the subarray the sum of products  $K_s \cdot K_s \cdot s$  for every positive integer  $s$ . The sum contains only finite number of nonzero summands as the number of different values in the array is indeed finite.

You should calculate the power of  $t$  given subarrays.

### Input

First line contains two integers  $n$  and  $t$  ( $1 \leq n, t \leq 200000$ ) — the array length and the number of queries correspondingly.

Second line contains  $n$  positive integers  $a_i$  ( $1 \leq a_i \leq 10^6$ ) — the elements of the array.

Next  $t$  lines contain two positive integers  $l, r$  ( $1 \leq l \leq r \leq n$ ) each — the indices of the left and the right ends of the corresponding subarray.

### Output

Output  $t$  lines, the  $i$ -th line of the output should contain single positive integer — the power of the  $i$ -th query subarray.

Please, do not use `%lld` specifier to read or write 64-bit integers in C++. It is preferred to use `cout` stream (also you may use `%I64d`).

### Examples

input	Copy
3 2 1 2 1 1 2 1 3	
output	Copy
3 6	

input	Copy
8 3 1 1 2 2 1 3 1 1 2 7 1 6 2 7	
output	Copy
20 20 20	

**Note**

Consider the following array (see the second sample) and its  $[2, 7]$  subarray (elements of the subarray are colored):

Then  $K_1 = 3$ ,  $K_2 = 2$ ,  $K_3 = 1$ , so the power is equal to  $3^2 \cdot 1 + 2^2 \cdot 2 + 1^2 \cdot 3 = 20$ .
