

## B. Karen and Coffee

time limit per test: 2.5 seconds  
memory limit per test: 512 megabytes  
input: standard input  
output: standard output

To stay woke and attentive during classes, Karen needs some coffee!

Karen, a coffee aficionado, wants to know the optimal temperature for brewing the perfect cup of coffee. Indeed, she has spent some time reading several recipe books, including the universally acclaimed "The Art of the Covfefe".

She knows  $n$  coffee recipes. The  $i$ -th recipe suggests that coffee should be brewed between  $l_i$  and  $r_i$  degrees, inclusive, to achieve the optimal taste.

Karen thinks that a temperature is *admissible* if at least  $k$  recipes recommend it.

Karen has a rather fickle mind, and so she asks  $q$  questions. In each question, given that she only wants to prepare coffee with a temperature between  $a$  and  $b$ , inclusive, can you tell her how many admissible integer temperatures fall within the range?

### Input

The first line of input contains three integers,  $n$ ,  $k$  ( $1 \leq k \leq n \leq 200000$ ), and  $q$  ( $1 \leq q \leq 200000$ ), the number of recipes, the minimum number of recipes a certain temperature must be recommended by to be admissible, and the number of questions Karen has, respectively.

The next  $n$  lines describe the recipes. Specifically, the  $i$ -th line among these contains two integers  $l_i$  and  $r_i$  ( $1 \leq l_i \leq r_i \leq 200000$ ), describing that the  $i$ -th recipe suggests that the coffee be brewed between  $l_i$  and  $r_i$  degrees, inclusive.

The next  $q$  lines describe the questions. Each of these lines contains  $a$  and  $b$ , ( $1 \leq a \leq b \leq 200000$ ), describing that she wants to know the number of admissible integer temperatures between  $a$  and  $b$  degrees, inclusive.

## Output

For each question, output a single integer on a line by itself, the number of admissible integer temperatures between  $a$  and  $b$  degrees, inclusive.

## Examples

input	Copy
3 2 4 91 94 92 97 97 99 92 94 93 97 95 96 90 100	
output	Copy
3 3 0 4	

input	Copy
2 1 1 1 1 200000 200000 90 100	
output	Copy
0	

## Note

In the first test case, Karen knows 3 recipes.

1. The first one recommends brewing the coffee between 91 and 94 degrees, inclusive.
2. The second one recommends brewing the coffee between 92 and 97 degrees, inclusive.
3. The third one recommends brewing the coffee between 97 and 99 degrees, inclusive.

A temperature is *admissible* if at least 2 recipes recommend it.

She asks 4 questions.

In her first question, she wants to know the number of admissible integer temperatures between 92 and 94 degrees, inclusive. There are 3: 92, 93 and 94 degrees are all admissible.

In her second question, she wants to know the number of admissible integer temperatures between 93 and 97 degrees, inclusive. There are 3: 93, 94 and 97 degrees are all admissible.

In her third question, she wants to know the number of admissible integer temperatures between 95 and 96 degrees, inclusive. There are none.

In her final question, she wants to know the number of admissible integer temperatures between 90 and 100 degrees, inclusive. There are 4: 92, 93, 94 and 97 degrees are all admissible.

In the second test case, Karen knows 2 recipes.

1. The first one, "wikiHow to make Cold Brew Coffee", recommends brewing the coffee at exactly 1 degree.
2. The second one, "What good is coffee that isn't brewed at at least 36.3306 times the temperature of the surface of the sun?", recommends brewing the coffee at exactly 200000 degrees.

A temperature is *admissible* if at least 1 recipe recommends it.

In her first and only question, she wants to know the number of admissible integer temperatures that are actually reasonable. There are none.
